CBS 2353 - Penetration Testing

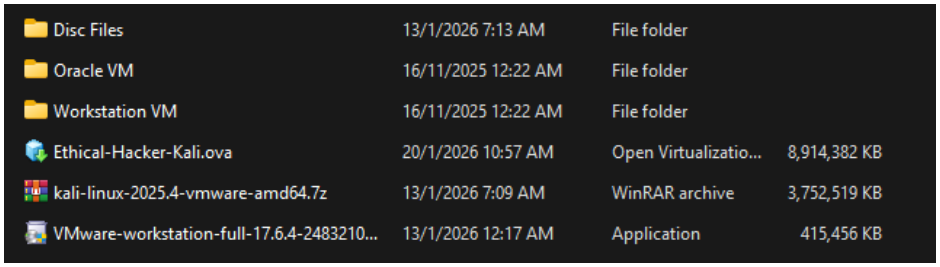

1.3.6 Lab - Deploy a Pre-Built Kali Linux Virtual Machine (VM)

Student's Name	**ABDUL HARIZ B. MOHD SARNUDIN**
ID Number	**CBS24070208**
Trade/Group/Sem	**DCBS / CBS 1 / SEMESTER 4**
TTO's Name	**Ts Noormelah Shamsul**

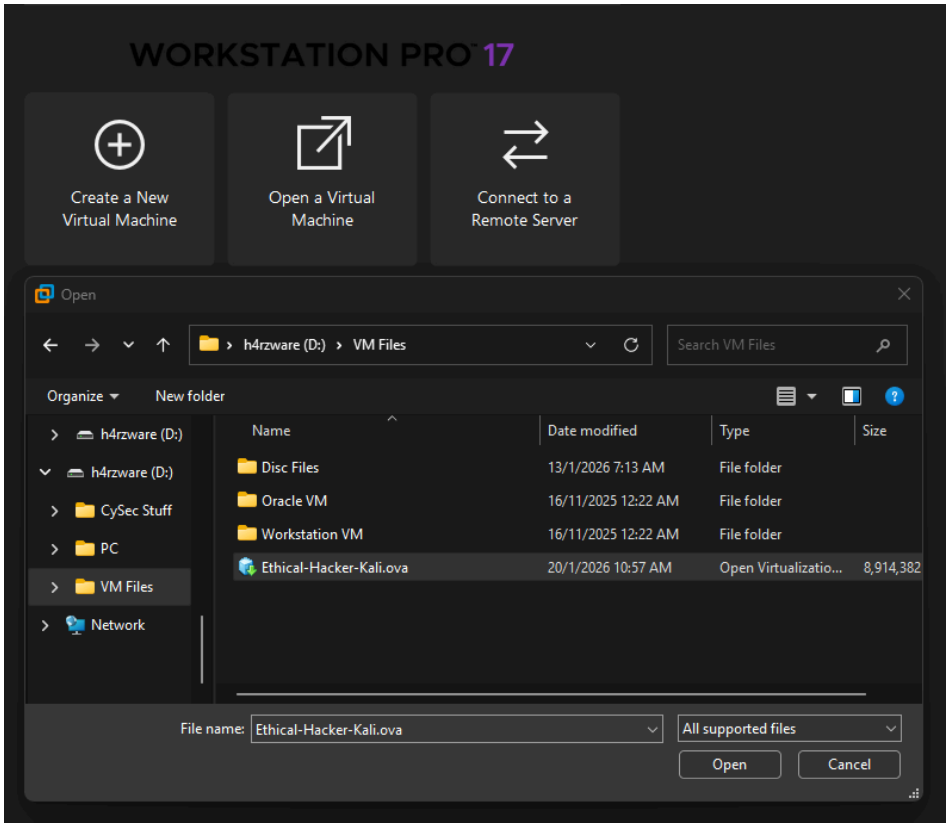

Deploying the Prebuilt-VM

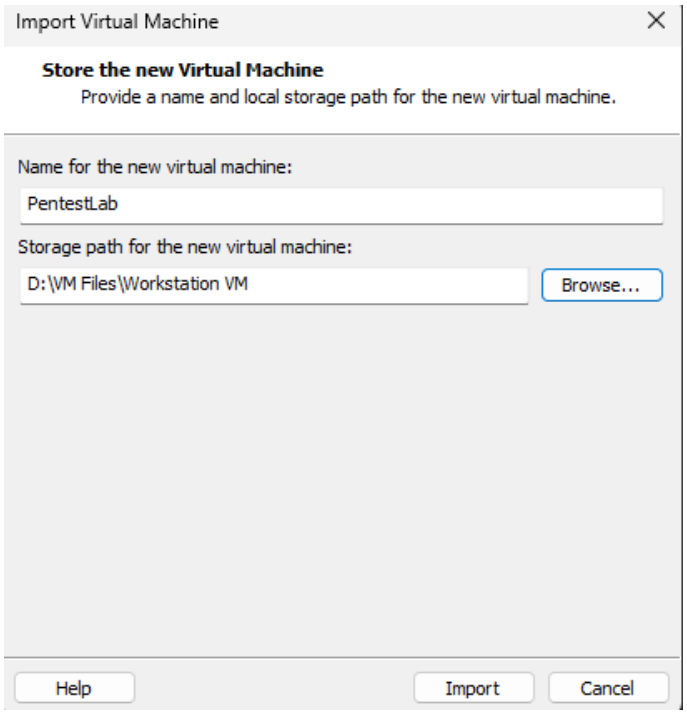

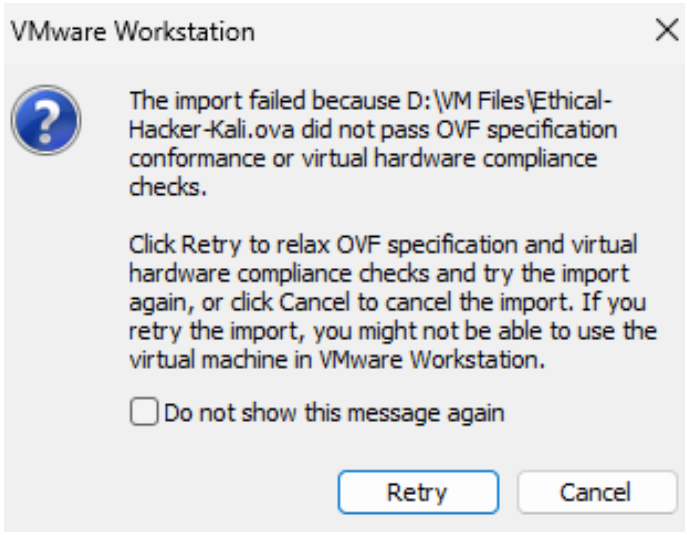

For this lab, I am using vmware workstation pro. Personal opinion, but I think that VMware is more optimized than VirtualBox. And the UI + Configuration Purpose are significantly better. It looks more professional hehe 😊

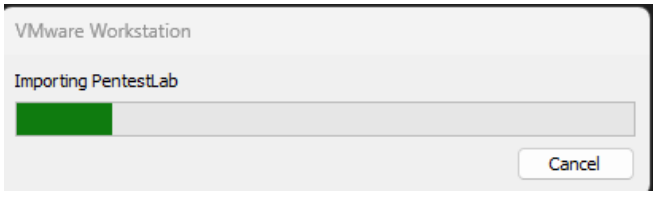

For this lab, we are using the installed prebuilt vm file (OVA). VMware typically uses vmdk files for their vm's, but OVA files work across most platforms, so in this case we can use VMware supposedly without any technical problems.

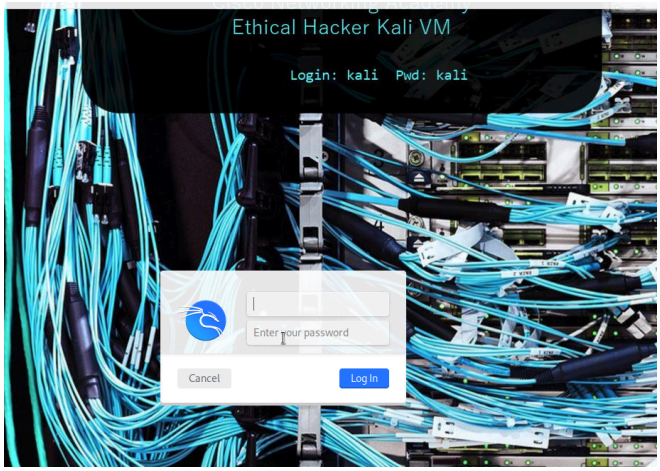

This warning message is normal, as OVA files are typically used for VirtualBox. Just click Retry and VMware will convert the OVA file to vmdk.

Our vm is now ready !

Step 2: Keyboard shortcuts

As you work in the terminal, you may find yourself retyping some commands or trying to remember a command, filename, or folder name. A few keyboard shortcuts can help you become more efficient at the terminal.

a. You can use the up or down arrow keys to locate and execute the previously entered command. In the terminal, press the up arrow until you find the **visudo** command.

How many times did you need to press up arrow? **Do not press enter unless you want to run the command again.**

Answer Area

2 times

Show Answer

Answer :

2.1

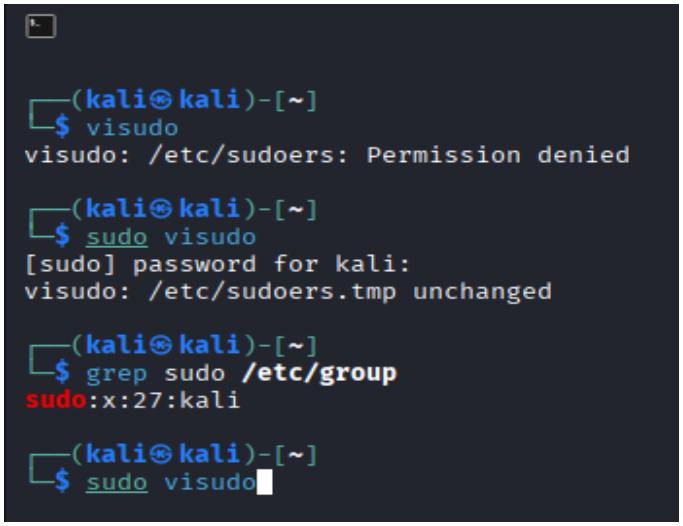

If you wanted to locate the **sudo visudo** command, how many times would you need to press the down arrow to find it? **Do not press enter unless you want to run the command again.**

Answer Area

Once

Answer :

2.2

b. What if you were looking for a command that you used a while ago? The command **history** allows you to view all the commands that you have used recently in the same terminal. At the prompt, delete the displayed command if necessary. Enter the **history** command to see a list of recently used commands.

```
┌──(kali㉿Kali)-[~]
└─$ history
    1  visudo
    2  sudo visudo
    3  grep sudo /etc/group
    4  history
```

The output displays the list of commands with a number beside each command that you just used in the previous step.

c. You can use a combination of the exclamation point (!) and history number or command string to repeat previously used commands.

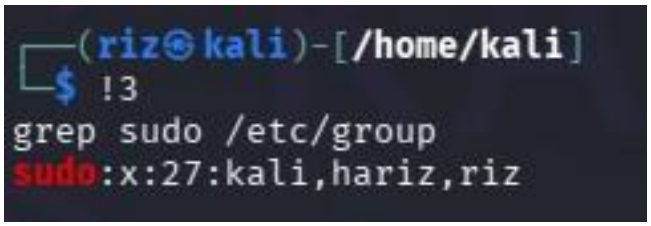

At the prompt, enter **!3**. What command is displayed?

Answer Area

grep sudo /etc/group

Show Answer

Answer :

2.3

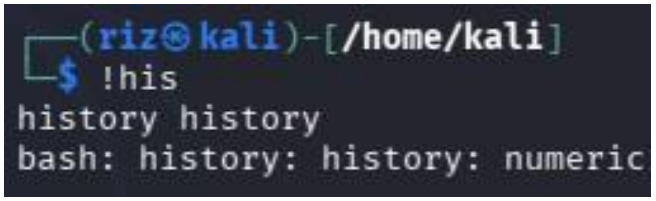

At the prompt, enter **!his**. What command is displayed?

Answer Area

history

Answer :

2.4

d. The tab key can help you complete a partial command or file or folder name.

At the prompt, enter **hi** and press the tab key. What is the output?

Answer Area

```
┌──(riz㉿kali)-[/home/kali]
└─$ hi
hipstopgm  hishrink   history    histretch  hitex
```

What are the benefits of using either the installer image or the pre-built image to create the Kali VM?

Answer Area

adjusted to suit their host machine's capacity. Though it might need some configuration to do and a bit time consuming for those who are not "tech-savvy".

Show Answer

Answer :
Pre-built images (ova or vmx) usually come pre configured with certain specs. It is significantly faster and convenient if the user wants a quick “install-and-use” vm files, however certain users might struggle with their high specs (storage and memory usage) as it is configured with recommended specs. Some host machines might have limited storage and memory to use prebuilt-vm files.

Installer image (iso files) on the other hand are preferable for those who want to configure their vm machine specs with their own comfort and choices. Storage and memory can be adjusted to suit their host machine's capacity. Though it might need some configuration to do and a bit time consuming for those who are less "tech-savvy".

Prebuilt VM specs (by default) :
